Introduction

The `string-set: chapter-title content()` declaration captures the heading text into a named string. `@top-left { content: string(chapter-title); }` then displays the most recent value on each page.

Page 1 top-left should read "Introduction".

Filler 1 to overflow page 1.

Filler 2 — additional
multi-line content
to push the chapter
onto a second page
so the carry semantic
is exercised.

Filler 3 — page 2 of "Introduction" should still show "Introduction" in the top-left because no new h2 has appeared yet (carry from previous page's last assignment).

Filler 4 — the carry semantic is the part that broke silently in Phase 3.4. If `collect_running_element_states` / `collect_string_set_states` regress, page 2's top-left will be empty.

Filler 5.

Filler 6.

Filler 7.

Background

A new chapter begins on this page. The top-left should now read "Background" because the new h2 updates the named string before the page header is resolved.

> Top-left here should read "Background".
