Link Stylesheet Example

This example demonstrates loading CSS via `<link rel="stylesheet" href="theme.css">` instead of the `--css` CLI flag.

How It Works

Automatic Base Path

When you pass an HTML file to the CLI, fulgur automatically sets the base path to the file's directory. Relative `href` values in `<link>` tags are resolved from there.

Local Files Only

Following fulgur's offline-first design, only local file paths are resolved. URLs starting with `http://` or `https://` are ignored.

Multiple Stylesheets

You can include multiple `<link>` tags. Each referenced CSS file is loaded and applied in order.
